256 Nests of Hydrogen Eggs

This drawing illustrates the exact number of protons and electrons at each stage of the matter reproduction cycle of the Living Universe. There were no protons or electrons “created” in this process. Each proton and electron was individually born of the origin hydrogen atom. The only thing that is happening in this multi-generational reproductive event is the continual and simultaneous bifurcation of single neutrons. A neutron is like a hydrogen egg that will eventually hatch in to a proton and electron.
